

GridSense AI

Bengaluru-Localized Smart Meter Intelligence & Revenue Recovery System for BESCOM

- Team: CEREBRIX LABS
- Team Lead: Nikhil Sai
- Theme 8: AI for Smart Meter Intelligence & Loss Detection by BESCOM

Problem Statement

Bengaluru utilities need fast, explainable loss detection from smart meter data.

Power theft and tampering create revenue leakage across dense Bengaluru feeder zones.

Manual anomaly review is slow and can create false positives.

Evening peak demand in residential and industrial areas is hard to anticipate from raw readings alone.

BESCOM officers need inspection priorities, not another raw-data dashboard.

12,480

smart meters simulated

18

high-risk meters

INR 2.4L

estimated loss detected

Brief About the Solution

GridSense AI converts Bengaluru smart meter patterns into demand, theft, and revenue decisions.

Forecast Demand

Predict hourly load and evening peak-risk windows for BESCOM zones.

Detect Theft

Flag abnormal drops, spikes, peer deviations, and tampering signals.

Recover Revenue

Rank inspection cases by confidence, loss impact, and urgency.

Opportunities and USP

Different from a normal dashboard: it explains and prioritizes action.

Typical dashboard

Shows historical readings; Requires manual anomaly search; Limited explainability; No revenue-priority workflow

GridSense AI

Predicts demand and grid stress; Detects theft-risk patterns automatically; Explains why a case was flagged; Creates BESCOM officer inspection priorities

Features Offered

Submission-ready capabilities demonstrated in the prototype.

Demand Forecasting

Actual vs predicted load with peak warning zone.

Bengaluru Zone Map

Peenya, Whitefield, KR Puram, Yelahanka, and Electronic City style zones.

Inspection Queue

Approve, reject, or escalate Bengaluru-area cases.

Theft Alerts

Critical, high, and medium risk meter anomalies.

Revenue Engine

Estimated loss, recovery potential, and zone loss chart.

Explainability

Reason, formula, and audit timeline for every alert.

Process Flow Diagram

Smart meter data to BESCOM officer action in one auditable workflow.

Architecture Diagram

Frontend-first, Vercel-safe decision-support layer on top of existing BESCOM systems.

Technologies Used

Modern frontend prototype with Google AI-ready architecture.

React

Vite

Tailwind CSS

Recharts

Framer Motion

Lucide Icons

Gemini API / Google AI Studio ready

Firebase / Google Cloud ready

Snapshots of the MVP

Core screens implemented in the live prototype.

Command Dashboard

Bengaluru impact metrics, simulate theft, live risk state

Demand Forecast

Actual vs predicted load and peak warning

AI Alerts

Meter risk, confidence, estimated loss, localized reason

Revenue + Queue

Loss recovery chart and officer actions

Implementation Cost and Future Development

Feasible as a staged pilot and scalable across zones.

Prototype

INR 0 cloud spend - static Vercel frontend with precomputed synthetic data

Pilot

Masked BESCOM connector, Gemini API, Firebase/GCP storage, officer login

Scale

Bengaluru circle rollouts, GIS map integration, model feedback loops

Future

Gemini assistant for officer case summaries

Future

Firebase ingestion pipeline for masked meter events

Future

Google Maps / BESCOM zone visualization

Future

Model feedback loop from inspection outcomes

Future

Role-based audit dashboard for senior officers

Submission Links and Demo Details

Ready for prototype submission. Replace placeholders after deployment/video upload.
